

Quick guide: bpmn for process modeling

- I recommend you to create a process model using basic BPMN2.0
- **Some of the benefits in comparison to using Petri nets:**
 - Easier to read and more compact than Petri nets
 - Much better tool support for modeling BPMN
 - Recommendation: <https://academic.signavio.com/> (use uni e-mail address to sign up. Select “Business Process Diagram (BPMN2.0)) or <https://bpmn.io/>
- If you understand Petri/workflow nets, modeling basic control flow in BPMN is straightforward (it is essentially *syntactic sugar*)
- **Benefit in comparison to using process maps from e.g., Disco:**
- You have full control over what you include in a model, e.g.,
 - You can set activity/event labels yourself
 - You can merge multiple activities into one if you like (i.e., abstraction) or otherwise choose what to include/exclude
 - You can explicitly model choices and parallelism

HOW TO: BPMN

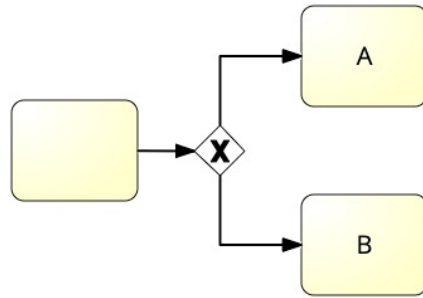

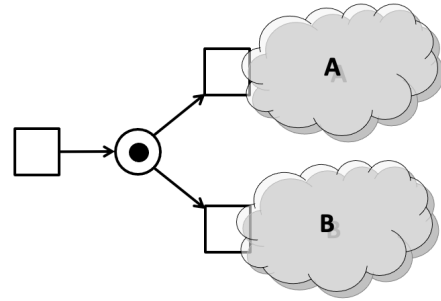

- Must **start with a start event, end with an end event**.
- **Use activities** (squares with rounded corners) to capture **steps performed by the organization** you are analyzing
- **Use intermediate events** (circles) to indicate **steps performed by outside parties**, e.g., receiving something from a customer
- You don't need to bother with different event types
- You don't need to model anything beyond activities, events, AND and XOR gateways
- However, if you include things such as organizational information, more complex gateways, sub-processes, other events, etc., make sure to use them correctly!

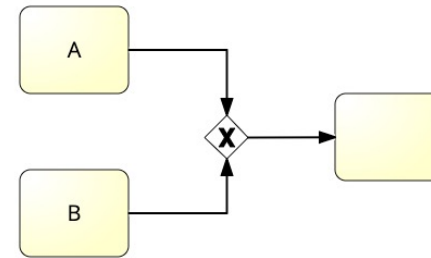

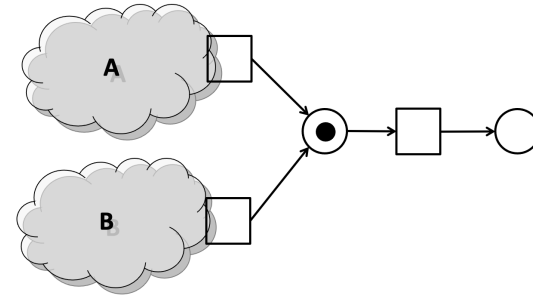

XOR Gateways (Choices in process)

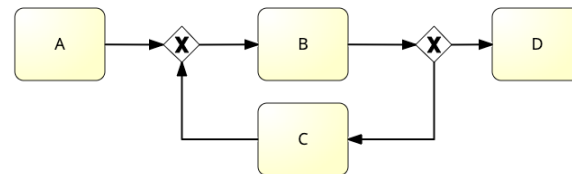

XOR Split

XOR Join

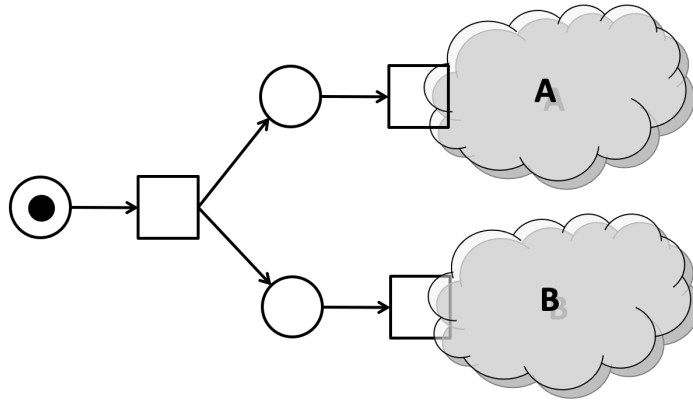

One-or-more loop

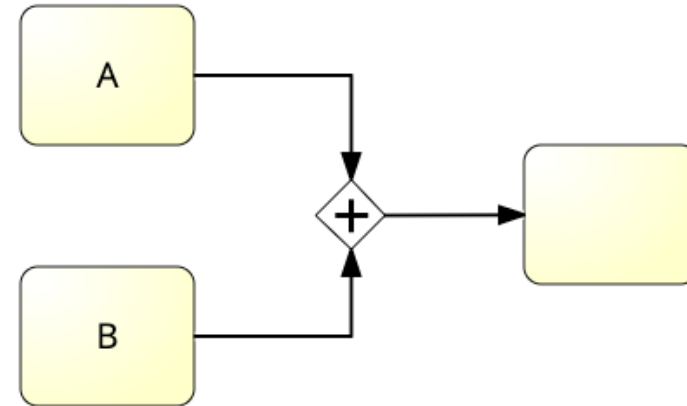

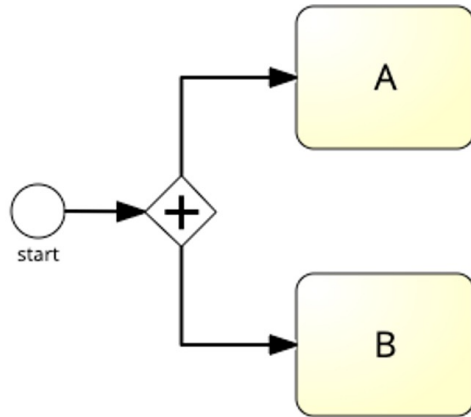

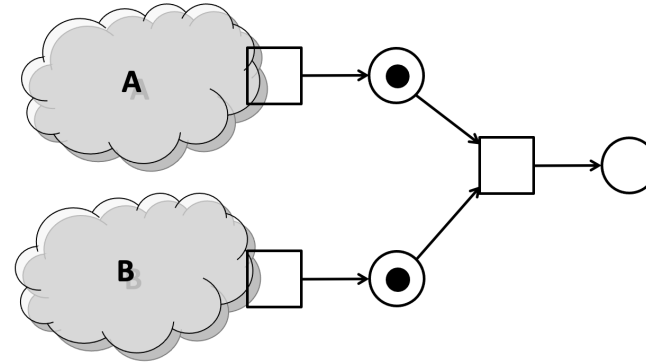

AND gateways (parallelism)

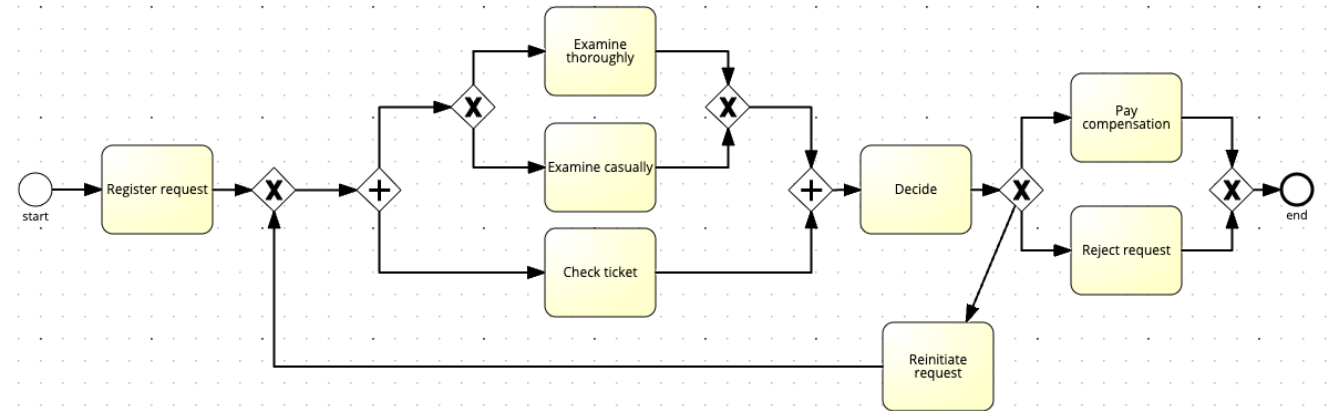

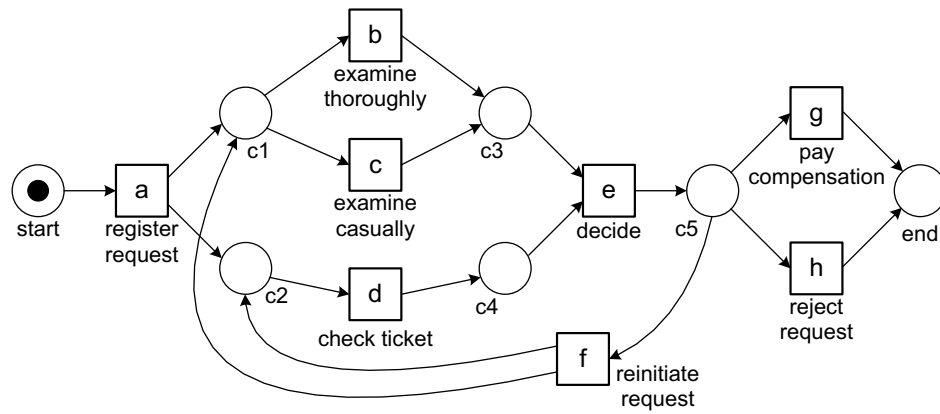

AND Split

AND Join

Our favorite example

General points (also If you don't go for bpmn)

- Using BPMN is not mandatory, of course. Use what you like. Just make sure that your models follow the convention of the particular notation.
- Make sure that whatever model you create is readable, has understandable activity/node labels, and generally just gives the information that is of interest in a clear manner.
- There are a lot of resources online about how to model properly or use different notations correctly.
- Use understandable activity labels! Use verb-object for activities (e.g., “create invoice” rather than “invoice creation”) and past tense for events (e.g., “request received”)
- I am happy to answer any modeling questions.
